

Project 3: Logical Database Design

Due date: 25 February 2026 before 9 p.m.

In this project, students are required to come up with a logical data model represented in the format of a relational model with respect to the conceptual data model presented in the previous project.

Things to do

- Apply the algorithm learned in the class for mapping the Entity-Relationship model to the **relational database schema**.
- Apply the normalization theory to verify your relational database schema and come up with a **normalized relational database schema** which is the logical data model. You may also need to verify your conceptual model accordingly.

Concerned Issues

1. Plagiarism is NOT allowed for any cases.
2. Creativity in design and presentation is preferable.

Deliverables

A document in portable document format (PDF). The content in the document includes:

1. The latest **ER diagram** presenting conceptual data model and, if any, the list of changes of the ER diagram.
2. The **relational database schema** and **integrity constraints** obtained from mapping of the ER diagram, as well as other constraints associated with each relation schema.
3. The **normalized relational database schema** obtained from applying the normalization theory.

Submissions

1. Name the report file as <ProjectID>_<GID>_<last-three-digit-of-StudentID for every team member>_report.pdf, for example, "**P3_G01_999_988_977_report.pdf**".
2. Submit the file on MyCourses.
